Auditing Tagging Process

A Framework for Validating Instructional Design and Event Data at the Center for Learning Analytics

Haiyi Cheng, Peizhen Li and Milena Páez-Silva

Abstract: This document presents a framework for auditing the instructional tagging process developed at the Center for Learning Analytics at the University of North Carolina at Chapel Hill. The process is organized into three phases. Phase 1 focuses on initial familiarization with the center's mission, research foundations, and instructional tagging framework. Phase 2 establishes the connection between course design and event data by examining course artifacts such as syllabi, schedules, and content clusters, and validating their alignment with tagging schema. Phase 3 involves the validation and analysis of tagged data through pivot tables and quantitative grids, enabling auditors to check consistency, temporal accuracy, and instructional intent alignment. Each phase includes detailed steps and screenshots from the tagging workbook.

Phase 1: Initial Familiarization with the Center for Learning Analytics at UNC

At this phase, the aim is to ensure that the person joining the labeling audit process understands where the research stands. The objective is to become familiar with both theory and practice, by understanding the files that will be worked with and how they are structured. This phase consists of three steps:

Step 1: Look at the official website of Center for Learning Analytics at the UNC School of Education. Reviewing the website will allow the person to learn about the center's mission, objectives, staff, and existing projects. This provides an understanding of the context in which the research is conducted.

Step 2: Read Plumley et al. (2024) – *Co-designing enduring learning analytics prediction and support tools in undergraduate biology courses.* This article is important because it presents a concrete example of how the center applies learning analytics in higher education courses. By reviewing this study, the person will gain insight into the theoretical foundations, the co-design approach with instructors, and the practical results of using labeling and prediction models.

Step 3: Review slides 2 through 7 of the Instructional Tagging Introduction to understand how the center organizes the tagging process. These slides present the logic of multimodal learning analysis, the role of course elements, and the key components of the tagging scheme. By studying these materials, you will gain a structured overview of how raw event data is enriched with course design elements. Figure 1 shows the Instructional Design Grid. This grid organizes course materials by instructional purpose and timing (before, during, or after class). It makes visible how each resource is intended to support learning, providing a clear framework for tagging and analysis. Next, reviewing slides 9 and 10 will help to visualize what the final tagged product looks like, providing a clear picture of the expected outcomes of the tagging process.

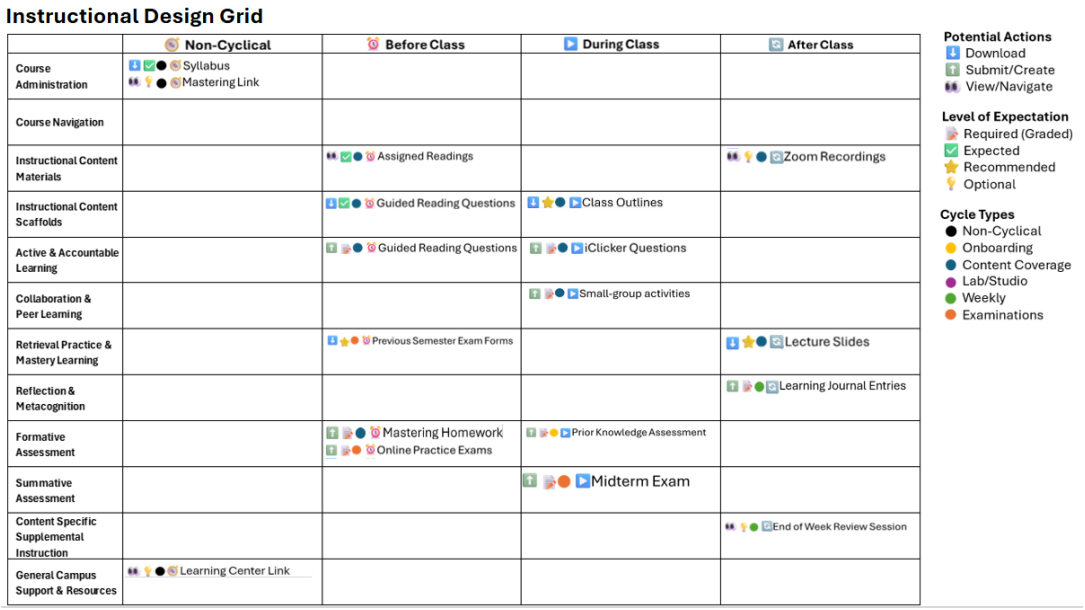

Figure *1. Instructional Design Grid Initial*

Phase 2: Establishing the Link Between Course Design and Event Data

In this phase, work begins on the files for a particular course. The objective of this phase is to connect the elements of instructional design, such as the syllabus and activity schedule, with the labeling and event logging scheme. This is where the validation process begins, as the auditor starts to form their first impressions of how the labeling process was generated. In this phase, we will work on steps 4 to 7.

Step 4: At this stage, a course is selected to work on, for example PHYS115 from the fall semester of 2024. The idea is to read the syllabus, review the course schedule, and compare them with the instructional design table (Figure 2). The objective of this step is to verify whether the planned instructional activities are aligned with the information in the official course documents. This is where the first comments and contributions are generated, with the auditor agreeing or disagreeing with the grid and helping to refine the outline so that the instructional intent is accurately captured.

Figure 2. ***Instructional Design Grid for PHYS115 (Fall 2024), showing how course resources and activities are mapped across instructional categories and phases of the learning cycle.***

Step 5: Review slide 13 of the Instructional Tagging Introduction and then move on to the Excel Workbook with the data tagging already completed. The objective of this step is to ensure that all the elements found in the instructional design grid are reflected in the Excel sheet called "Common + Instructional Tagging", showing in Figure 3. The auditor must verify that the definitions and categories tagged match the grid. If there are any doubts or to verify understanding of the concepts used, you can read the process overview sheets (Figure 4) and instructional labeling diagram (Figure 5).

Figure 3. ***Excerpt from the "Common + Instructional Tagging" sheet in the Instructional Tagging Workbook.***

1	**Tagging Process**	**Description**
2	1) Instructional Intent Design Grid	Utilizing the syllabus, course schedule and objects list, bookmarking course content materials to the instructional intent, intended timing, and cycle type. Content should be uniformed utilizing color coding and mapping of content to their high location
3	2) Common+Instructional Tagging	Similarly to the instructional intent Design Grid, utilizing the syllabus to bookmark course content material to into this tab. Within this tab more specific can be figured here incorporating further information such as "delivery platform," "zoom," "at time frame," etc. This information will look to be significant to the course level and guiding content as necessary based on the Key Course Attributes.
4	3) Cluster Topics	Mapping of content topics to Content Cluster labels. Content organizer and assessment mappings are documented.
5	4) Course Weights List	List out all course weighing dates and times, labeling each with appropriate weighing number and the content cluster labels. More specific information such as attendance expectations & local exam, The purpose is to provide a documentation of all course weights to help determine whether an event is on-time, delayed, etc.
6	5) Object Names to CIT	Roper will provide the Object Type, Name and Action Type, as well as other pertinent information from the object files documents for each class. each Object will be mapped to the Content Cluster, Organization, and assessment Mapping
7	6) Interaction Data Lookup	List out all of the calendar dates during the course semester, indicating whether the date corresponds to a local meeting
8	7) Tag Events	The application of look-ups from files from tabs 2, 3, and 5 to a long-form event file. This exists separately as if is a very large file on its own.
9	7a) Tag Events Readme	Descriptions of sample headers in 7) Tagged Events
10	8) Instructional Intent Grid	Presents multiple data of common name events, organized by instructional intent categories. This shows the number of students multiple students access vs no access, total number of access, average number of access, and percentages. Allows for instructor to investigate the breakdown of access for students during the course of the semester.
11	8a) Grant Sandbox	Not table linked to 7) Tagged Events for exploratory analysis

Figure 4. ***Process Overview sheet from the Instructional Tagging Workbook, summarizing the main steps and definitions used in the tagging process.***

Tag Type	Tag Values	Tag Description
Action	Download	Acquire a copy of files (e.g., .doc, .ppt, .pdf) from the digital platform for use on local machine
Action	Post	Create a discussion or message
Action	Reply	Create a response to a discussion or message
Action	Submit	Submit a completed submission to an asisgnment
Action	Update	Edit an assignment submission or discussion contribution
Action	Attach	Include a file on a generated submission, discussion contribution, etc.
Action	View	Load or navigate to web pages(e.g., course pages, discussion pages, external links)
Expectation	Required	Actions directly related to a graded activity.
Expectation	Expected	Mandatory but not graded (e.g., pre-class readings, downloading files needed for graded activites).
Expectation	Recommended	Strongly encouraged but not required.
Expectation	Optional	Extra/enrichment material for deeper learning or review.
Cycle Phase	Non-Cycilical	Resources available throughout the course, not tied to phases.
Cycle Phase	Before Meeting	Resouces/activities intended to be engaged with before the related class meeting
Cycle Phase	During Meeting	Resouces/activities intended to be engaged with during the related class meeting
Cycle Phase	After Meeting	Resouces/activities intended to be engaged with after the related class meeting has occurred
Cycle Type	Non-Cyclical	Resources and activities that are not related to a specific class meeting or topic.
Cycle Type	Onboarding	Introductory activities to familiarize students with course expectations.
Cycle Type	Content Coverage	Instructional sessions focused on delivering and exploring course material.
Cycle Type	Lab/Studio	Hands-on, practical sessions for applying concepts in real-world scenarios.
Cycle Type	Weekly	Recurring sessions/assignments that maintain course rhythm and reinforce learning.
Cycle Type	Examinations	High-stakes, summative assessments.
Instructional Intent	Course Administration	Documents and tools that provide structural organization and course policies.
Instructional Intent	Course Navigation	Viewing of course site pages and external links.
Instructional Intent	Instructional Content Materials	Core instructional materials that provide foundational knowledge on course topics.
Instructional Intent	Instructional Content Scaffolds	Resources designed to guide students in understanding and organizing new information.
Instructional Intent	Active & Accountable Learning	Activities intended to encourage engagement where students apply and explore concepts interactively.
Instructional Intent	Collaboration & Peer Learning	Opportunities for students to engage in peer-supported learning experiences.
Instructional Intent	Retrieval Practice & Mastery Learning	Strategies that enhance retention and recall of key concepts through structured practice.
Instructional Intent	Reflection & Metacognition	Resources and activities that encourage students to reflect on their learning process.
Instructional Intent	Formative Assessment	Low-stakes assessments providing students with feedback on their understanding.
Instructional Intent	Summative Assessment	High-stakes evaluations used to measure students' mastery of the course material.
Instructional Intent	Content Specific Supplemental Instruction	Supplemental instruction of course specific content provided by the learning center, teaching-assistants, peer-mentors, etc.
Instructional Intent	General Campus Support & Resources	University-based services to develop students' academic writing, and research.
Stakes	No Stakes	Not direcly related to a graded activity. This applies to viewing or downloading instructional materials unless the event is direcly related to participation points or grades are explicitly assign
Stakes	Low-Stakes	Very low % of course grade, often evaluated based on participation not correctness
Stakes	Mid-Stakes	Meaningful, but not substancial % of course grade. Evaluated based on correctness.
Stakes	High-Stakes	Substancial portion of final course grade. Evaluated for correctness.

Figure 5. ***Instructional Tagging Schema sheet, detailing the categories and labels applied to course elements during the tagging process.***

Step 6: The auditor should now familiarize themselves with the "Content Cluster" sheet in the labeling workbook (see Figure 6) and compare it with the course syllabus. By reviewing this sheet, the auditor ensures that the labeling structure accurately reflects the duration and sequence of the course. This step also allows for the identification of discrepancies between the intended organization of the course and the way events are grouped in the labeling process, providing an early opportunity to refine the cycle.

26	Radical Reactions 2 and Final Review	L25	Unit 07	Exam 4

Figure 6. ***Content Clusters sheet from the Instructional Tagging Workbook, showing how individual content topics are grouped into clusters and aligned with course organizers and assessments.***

Step 7: Now we move on to reviewing the tagged events sheet of the document in Excel to understand how student interactions with course materials were tagged. This sheet (Figure 7) documents raw event data, such as downloads, submissions, or views, and connects them to the categories created in the design grid. It is important to note that this process was performed manually by researchers, meaning that human judgment influenced the classification of events. By examining this sheet, the auditor gains insight into the practical challenges of tagging, such as consistency, accuracy, and the need for clear guidelines in order to tag the number of rows presented. At this stage, it would be useful to have an explanatory video illustrating how this labeling process was carried out, to clarify how the person reviewed the names of the listed objects and tagged them.

3) Content Clusters | 4) Course Meetings List | 5) Object Names to CIT | 6) Interaction Date Lookup | 7) Tagged Events | Detail1 | 8) Inst. Int

Figure 7. ***Tagged Events sheet from the Instructional Tagging Workbook, showing how raw student interactions with course materials are manually categorized and aligned with instructional tags.***

Phase 3: Validation and Analysis of Tagged Data

At this stage, the focus is on reviewing and confirming the accuracy of the tagging scheme through detailed data analysis. The auditor works with pivot tables and tagged data sets to explore how student interactions with elements are represented, identifying inconsistencies and verifying that the tagging reflects the course design.

Step 8: Examine the pivot table found in the "Instructional Intent Quant Grid" in the workbook. This table (Figure 8) shows the count of events by object, providing a percentage of how students interacted with different elements of the course. The auditor should carefully review the grid to identify patterns, inconsistencies, or anomalies that stand out, such as unusually high or low engagement with specific materials.

Figure *10. Additional Object Name Granularity Added to Existing Categories*

These two pivot tables demonstrate Step 9's approach to understanding temporal tag accuracy through progressive data granularity. Figure **9** shows materials already organized by multiple hierarchical categories (content_cycle_type, content_cycle_phase, content_instructional_intent, content_common_name, etc.) displaying their access patterns across time phases. Figure **10** builds on this same categorization structure by adding object_name as an additional row field, revealing individual files like "KJF_Chapter10.7.pdf" and specific assignments (WU10-WU15) within the existing category framework. This demonstrates how adding one more level of detail helps identify which specific files within each category have problematic temporal patterns requiring investigation.

Step 10: Check temporal tag accuracy by creating a new sheet with first and last access data that cause questions/concerns.

Figure *1111. First Access Timing Distribution for Problems & Exercises Materials*

This pivot table shows when different Problems & Exercises files are first accessed across content clusters and exam periods.

Step 11: Check instructional intent accuracy by analyzing temporal mismatches that combine action type (access, download, submit) with temporal context, focusing on actions occurring after the expected phase (especially after multiple meetings) to identify when timing and behavior type together change the instructional function.

Figure 1212. ***Lab Instructions with Static Intent Labels Across Multiple Access Times***

As this screenshot shows, Lab Instructions materials all labeled "Active & Accountable Learning" despite being accessed at different times - before class, during class, and after class (highlighted in yellow). The expected phase is "During Meeting" but actual access spans multiple temporal phases. This demonstrates how static instructional intent labels fail to capture that materials serve different functions when accessed outside their intended timeframe.

Step 12: Intended phase vs % of temporal phase for first access

To begin our audit process, we compared the intended instructional phases (before, during, after meeting, non-cyclical) (see figure 1) with the temporal phases observed in student data. Using pivot tables, we calculated the proportion of first and total accesses for each phase. For example, while the syllabi indicated that 36.8% of student interaction should occur after meeting, the data shows 48.41% of actual interactions fell into this phase. (see figure 2)

Intended phase		
Row Labels	**Count of context_sis_source_id**	
After Meeting	15586	37%
Before Meeting	7018	17%
During Meeting	9952	23%
Non-Cyclical	9794	23%
Grand Total	**42350**	

Figure 1 Students' total count based on intended phase

non_cyclical	10181	
post_ldoc	1496	
pre_fdoc	629	
Grand Total	**42350**	

Figure 2 Students' total count based on temporal event cycle phase

This discrepancy does not by itself explain why the difference occurred, but it **signals a potential mismatch** between design and behavior. Rather than concluding that students postponed engagement, we use this phase-level comparison as an initial screen to flag areas that merit closer review.

To formalize this check, we compute a mismatch ratio (temporal ÷ intended). Ratios substantially greater than 1 (e.g., after meeting≈ 1.1) indicate over-representation in each phase, while ratios substantially lower than 1 (e.g., during meeting≈ 0.32) suggest under-representation relative to expectations. These ratios highlight which phases and resources should be examined further.

Finally, we determined that the temporal cycle phase list should include all individual events, not just aggregated categories. This more granular view allows us to trace mismatches back to specific resources (e.g., additional readings, warm-ups, assignments) and better understand where student behaviors diverge from the intended design.

Step 13 What signs in the data might indicate inaccurate labels for specific objects?

To move from aggregate patterns to specific resources, we examined Additional Reading in PHYS114. According to the instructional tagging schema, this content was intended to support preparation before meeting. However, the temporal phase data (see figure 3) shows that most accesses occurred after meeting (268 out of 450 total events, compared to only 85 before meeting).

This misalignment suggests that the current labeling may not accurately reflect how students are engaging with this resource. Instead of serving as pre-class preparation, students appear to be using Additional Reading primarily for post-class review. Such evidence indicates a potential labeling mistake and raises the question of whether the intentional intent should be revised.

Screenshots of these distributions can help illustrate the mismatch. By grounding the review in object-level data, we can better decide whether this resource's classification should remain unchanged or be updated to reflect actual student usage.

Step 15: How should we account for different population sizes vs it simply being an infrequently utilized object?

See this link.
